Acidic Patterns

Acids & Bases

If a solution has more hydrogen ions it is **acidic**.

If a solution has more hydroxide ions it is **basic**.

Acids & Bases by Arrhenius (this guy)

This is the Arrhenius' definition of an **acid** and **base**.
There are more ways of classifying bases and acids.

Bases we are Using Today!

1. Sodium Carbonate, Na_2CO_3
2. Sodium Hydrogen Sulfate, NaHSO_4

*Where are the
hydroxides?*

When we put these substances in water, they cause water to “fall apart” and split:

They then snatch
this guy up!!

E.g. Sodium Carbonate

Sodium Carbonate $\rightarrow$ Sodium ions + Carbonate ions

Carbonate ions + Water $\rightarrow$ Hydroxide ions + **Hydrogen** Carbonate ions

They then snatch
this guy up!!

pH

Acid
pH = 6.0

Neutral
pH = 7.0

Alkaline
pH = 8.0

Method

Disclaimer we are using a different indicator so it won't look the same - don't worry :)
